

Lab 1: Web Server Report

Name: jigmi sherpa

1. IMPLEMENTATION SUMMARY

I completed the skeleton code in WebServer.py. The server listens on port 6789.

For each request, it reads the file name, sends the file with a "200 OK" header,

or sends "404 Not Found" if the file does not exist. I also wrote a

multithreaded server and a simple client (optional exercises).

2. KEY FUNCTIONS

- bind() / listen(): set up the server on port 6789.
- accept(): wait for a browser to connect.
- recv(): read the HTTP request and get the file name.
- open() / read(): read the requested file.
- send(): send the header and the file, or the 404 message.
- close(): close the connection.

3. VALIDATION

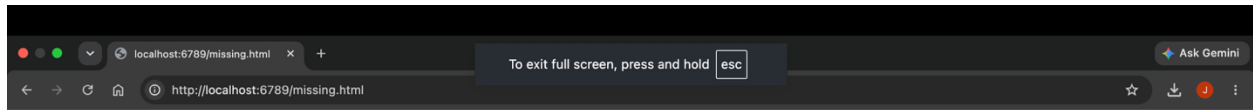

Requesting `http://localhost:6789/HelloWorld.html` shows the page.

Hello World!

Lab 1.

Requesting `http://localhost:6789/missing.html` shows 404 Not Found.
